

PayVoice Rescue

The voice agent that makes the call small firms avoid: chasing an overdue invoice.

THE PROBLEM

Everyone knows who owes them. Nobody makes the call.

Collections is uncomfortable, repetitive, and never urgent enough to do today. So the invoice ages, and the cash gap widens.

56%

of US small businesses are carrying unpaid invoices

\$17,500

average owed per affected business

47%

have invoices more than 30 days overdue

An invented promise is worse than no promise

A voice agent does not only speak. It fills in the date, the amount and the callback number. When it guesses, you do not get an awkward sentence. You get a dated commitment with a reference number that nobody made.

WHAT THAT COSTS

A chase cycle spent on a promise that never existed, a cash forecast built on it, and a customer told they broke their word.

WHY NOBODY CATCHES IT

The call sounded fine. The transcript reads fine. The error only surfaces weeks later, when the money does not arrive.

One call. Two acceptable endings.

PROMISE TO PAY

The caller names a date. The agent records it with an amount, a callback number and a reference, then repeats the date back.

PAY NOW

The caller wants to settle. The agent issues a payment link and stops talking. The link is simulated in this demo.

It asks who is speaking, looks the invoice up before discussing a number, and keeps every reply to a sentence or two.

Every tool call, on screen, as it happens

`lookup_invoice {"invoice_id":"20492"} → $750.00, 30 days overdue`

`log_promise {"promise_date":"2026-10-14"} → PROM-20492-4K8QZR`

`create_deposit {"amount_cents":75000} → simulated link`

- **Tool guards** a promise is refused if the callback number was never said, or the date is past or not a real date
- **Keyterms** configured for invoice numbers and company names
- **Turn detection** tuned for silence windows and barge-in
- **Session tokens** minted server-side, so the API key never reaches the browser

A promise a human can check

When the call ends, the record is fetched back from the session AssemblyAI stored, and every promise is flagged for review rather than presented as settled.

PROMISE TO PAY · NEEDS REVIEW

Pay by 14 October 2026 · **\$750.00**

Ref PROM-20492-4K8QZR

"I can pay it on the fourteenth of October."

The turn it was recorded on, transcribed at 91%. Confidence measures transcription, not agreement.

BESIDE IT

Every caller turn, so the quote is read in context. Each tool call and how long it took. Refused and timed-out attempts never become the promise.

Sold to the person who makes the call today

- **Buyer:** owner or bookkeeper at a small B2B services firm, chasing 10 to 50 invoices a month
- **Alternative today:** do it themselves, or hand the debt to an agency
- **Pricing:** per recovered invoice, or a flat monthly fee well under an agency's cut
- **Why voice:** email is ignored; a call gets a named person and a date
- **Proven market:** Peakflo, Resolve Pay and Thoughtly already sell AI collection calls to larger firms

What this is not, and what comes next

OUT OF SCOPE

Consumer debt collection, which is regulated. Not a dialer, not a payment processor, not a CRM.

IN THIS DEMO

Mocked invoice data. One invoice, one debtor, no real money and no real phone call.

- **Next:** HTTP tools so the same agent answers a real phone number over SIP
- **Next:** a webhook that sends the record to the collections team when a call ends
- **Next:** read the ledger from accounting software instead of a fixture
